**2.**

# Logistic regression

**Logistic regression** is used in various fields, including machine learning, most medical fields, and social sciences.

Logistic regression may be used to predict whether a patient has a given disease (e.g. [diabetes](#); [coronary heart disease](#)), based on observed characteristics of the patient (age, sex, [body mass index](#), results of various [blood tests](#), etc.).

Another example might be to predict whether an American voter will vote Democratic or Republican, based on age, income, sex, race, state of residence, votes in previous elections, etc.

## Stata

- logistic hcv age marry sex

## Different from GLM

- Dependent variable: “0” or “1”, not cardinal numbers.

# 3.

3.1 Suppose you observe that in  $n=1000$  mails (in 1 week) you have about 2 scams. Use the LvB /Poisson pdf to calculate that you have 6 scam emails in 2 weeks.

3.2 In Scammyland you have 5 scams on average, what is the probability to have no scam mail.

## 3.1 R code:

```
> lambda=2  
> x=3  
> dpois(x,lambda)
```

## 3.2 R code:

```
> lambda=5  
> x=0  
> dpois(x,lambda)
```

## 2. Make 3-5 slides (in PPTX) on the DSA (Digital Signature Algorithms)

A **digital signature** is a mathematical scheme for demonstrating the authenticity of digital messages or documents. A valid digital signature gives a recipient reason to believe that the message was created by a known sender ([authentication](#)), that the sender cannot deny having sent the message ([non-repudiation](#)), and that the message was not altered in transit ([integrity](#)).

Digital signatures are often used to implement [electronic signatures](#), a broader term that refers to any electronic data that carries the intent of a signature, but not all electronic signatures use digital signatures. In some countries, including the United States, [Turkey](#), [India](#), Brazil, Indonesia, [Mexico](#), Saudi Arabia, [Switzerland](#) and the countries of the [European Union](#), electronic signatures have legal significance.

5.

Try the creation of PGP (Pretty Good Privacy), a public-key encryption software package for the protection of electronic mail. Since PGP was published domestically as freeware in June of 1991, it has spread organically all over the world, and has since become the de facto worldwide standard for encryption of e-mail, winning numerous industry awards along the way. For three years I was the target of a critical investigation by the US Customs Service, who suspected that letters were broken when PGP opened outside the US. That investigation was closed without indictment in January 1995.

Computers were developed in secret back in World War II mainly to break codes. Ordinary people did not have access to computers because they were too in a number and too expensive. Some people pointed out that there would never be a need for more than half a dozen computers in the country, and concluded that ordinary people would never have a need for encryption. Some of the government's officials knew that cryptography today were known in that period, and to meet the old estimates about things were. Why would ordinary people need to have access to good cryptography?

Digest

Try the creation of PGP (Pretty Good Privacy), a public-key encryption software package for the protection of electronic mail. Since PGP was published clandestinely as freeware in June of 1991, it has spread organically all over the world, and has since become the de facto worldwide standard for encryption of e-mail, winning numerous industry awards along the way. For three years I was the target of a criminal investigation by the US Customs Service, who suspected that I was involved when PGP spread outside the US. That investigation was closed without indication it is January 1995.

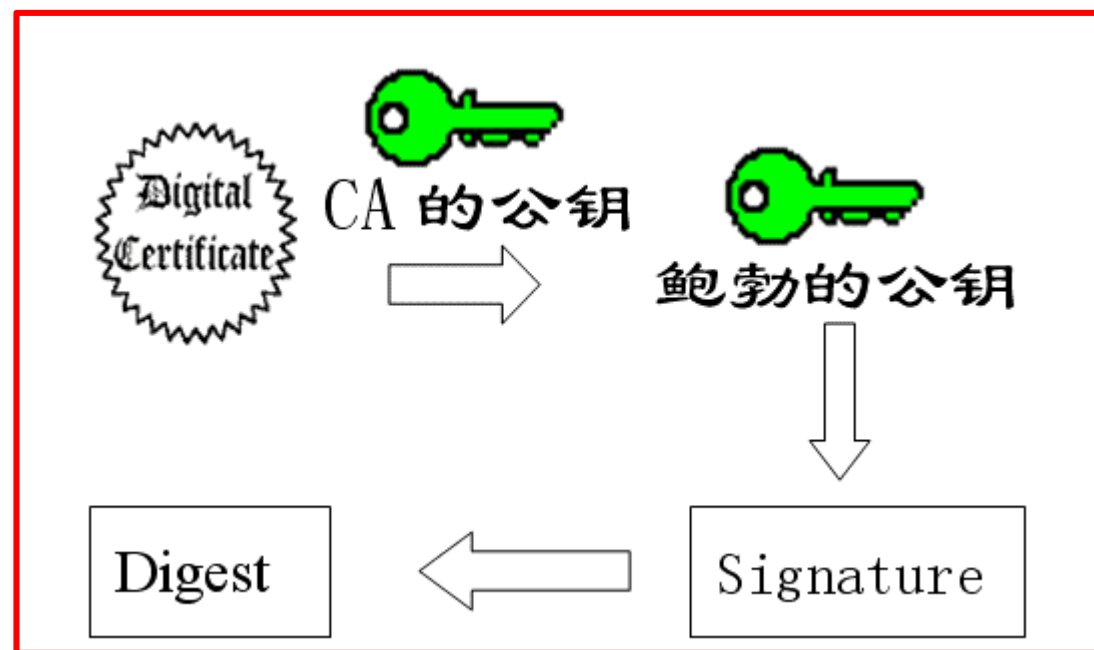

Computers were developed in secret back in World War II mainly to break codes. Ordinary people did not have access to computers because they were too expensive and too expensive. Since people panicked that there would never be a need for more than half a dozen computers in the country, and even if that still any people would never have a need for computers. Some of the government's attitude toward cryptography today were formed in that period, and because the old attitudes toward computers were. Why would ordinary people need to have access to good cryptography?

Signature

Certificate Authority(CA)

Digital Certificate(DC)

Let  $H$  be the hashing function and  $m$  the message:

- Generate a random per-message value  $k$  where  $1 < k < q$
  - Calculate  $r = (g^k \bmod p) \bmod q$
  - In the unlikely case that  $r = 0$ , start again with a different random  $k$
  - Calculate  $s = k^{-1} (H(m) + xr) \bmod q$
  - In the unlikely case that  $s = 0$ , start again with a different random  $k$
  - The signature is  $(r, s)$
- 
- Reject the signature if  $0 < r < q$  or  $0 < s < q$  is not satisfied.
  - Calculate  $w = s^{-1} \bmod q$
  - Calculate  $u_1 = H(m) \cdot w \bmod q$
  - Calculate  $u_2 = r \cdot w \bmod q$
  - Calculate  $v = (g^{u_1} y^{u_2} \bmod p) \bmod q$
  - The signature is invalid unless  $v = r$
